190.13 - Human Immunodeficiency Virus (HIV) Testing
(Prognosis Including Monitoring)

Other Names/Abbreviations
HIV-1 or HIV-2 quantification or viral load

Description
HIV quantification is achieved through the use of a number of different assays which measure the amount of circulating viral RNA. Assays vary both in methods used to detect viral RNA as well as in ability to detect viral levels at lower limits. However, all employ some type of nucleic acid amplification technique to enhance sensitivity, and results are expressed as the HIV copy number.

Quantification assays of HIV plasma RNA are used prognostically to assess relative risk for disease progression and predict time to death, as well as to assess efficacy of anti-retroviral therapies over time.

HIV quantification is often performed together with CD4+ T cell counts which provide information on extent of HIV induced immune system damage already incurred.

HCPCS Codes (Alphanumeric, CPT@AMA)

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>87536</td>
<td>Infectious agent detection by nucleic acid (DNA or RNA); HIV-1, quantification</td>
</tr>
<tr>
<td>87539</td>
<td>Infectious agent detection by nucleic acid (DNA or RNA); HIV-2, quantification</td>
</tr>
</tbody>
</table>

ICD-10-CM Codes Covered by Medicare Program

The ICD-10-CM codes in the table below can be viewed on CMS’ website as part of Downloads: Lab Code List, at http://www.cms.gov/Medicare/Coverage/CoverageGenInfo/LabNCDsICD10.html

<table>
<thead>
<tr>

<tbody>
<tr>
<td>B20</td>
<td>Human immunodeficiency virus [HIV] disease</td>
</tr>
<tr>
<td>B97.35</td>
<td>Human immunodeficiency virus, type 2 [HIV 2] as the cause of diseases classified elsewhere</td>
</tr>
<tr>
<td>O98.411</td>
<td>Viral hepatitis complicating pregnancy, first trimester</td>
</tr>
<tr>
<td>O98.412</td>
<td>Viral hepatitis complicating pregnancy, second trimester</td>
</tr>
<tr>
<td>O98.413</td>
<td>Viral hepatitis complicating pregnancy, third trimester</td>
</tr>
<tr>
<td>O98.419</td>
<td>Viral hepatitis complicating pregnancy, unspecified trimester</td>
</tr>
<tr>
<td>O98.42</td>
<td>Viral hepatitis complicating childbirth</td>
</tr>
<tr>
<td>O98.43</td>
<td>Viral hepatitis complicating the puerperium</td>
</tr>

NCD 190.13

*January 2024 Changes
ICD-10-CM Version – Red

Fu Associates, Ltd.

January 2024

42
### Indications

1. A plasma HIV RNA baseline level may be medically necessary in any patient with confirmed HIV infection.

2. Regular periodic measurement of plasma HIV RNA levels may be medically necessary to determine risk for disease progression in an HIV-infected individual and to determine when to initiate anti-retroviral treatment regimens.

3. In clinical situations where risk of HIV infection is significant and initiation of therapy is anticipated, a baseline HIV quantification may be performed. These situations include:
   a. Persistence of borderline or equivocal serologic reactivity in an at-risk individual.
   b. Signs and symptoms of acute retroviral syndrome characterized by fever, malaise, lymphadenopathy and rash in an at-risk individual.

### Limitations

1. Viral quantification may be appropriate for prognostic use including baseline determination, periodic monitoring, and monitoring of response to therapy. Use as a diagnostic test method is not indicated.

2. Measurement of plasma HIV RNA levels should be performed at the time of establishment of an HIV infection diagnosis. For an accurate baseline, 2 specimens in a 2-week period are appropriate.

3. For prognosis including anti-retroviral therapy monitoring, regular, periodic measurements are appropriate. The frequency of viral load testing should be consistent with the...
most current Centers for Disease Control and Prevention guidelines for use of anti-retroviral agents in adults and adolescents or pediatrics.

4. Because differences in absolute HIV copy number are known to occur using different assays, plasma HIV RNA levels should be measured by the same analytical method. A change in assay method may necessitate re-establishment of a baseline.

5. Nucleic acid quantification techniques are representative of rapidly emerging & evolving new technologies. Users advised to remain current on FDA-approval status.

**ICD-10-CM Codes That Do Not Support Medical Necessity**

Any ICD-10-CM code not listed in either of the ICD-10-CM covered or non-covered sections.

**Other Comments**

Assessment of CD4+ T cell numbers is frequently performed in conjunction with viral load determination. When used in concert, the accuracy with which the risk for disease progression and death can be predicted is enhanced.

**Sources of Information**
