You can help scientists by sharing your genomic health story

*All of Us* is a research program at the National Institutes of Health (NIH). The goal of the *All of Us* Research Program is to help scientists understand more about why people get sick or stay healthy. The program is asking one million or more people to join.

People who join will share their health information with us. Scientists will use their health data to do studies. This may help improve health for everyone. Together, we’re going to make a healthier future for all of us.

In the past, medical research has left many people behind. The *All of Us* Research Program wants to change that by including everyone. Only when all communities are part of medical research can all of us gain from future medical advances. People of all races, genders, cultures, physical abilities, and geographical locations are encouraged to join *All of Us*. That is why we encourage you to join *All of Us* today.

You can participate in *All of Us* without traveling from where you live. Once you’ve Joined *All of Us*, you can choose what to do and share. You can share your health records, including the Genomic DNA Test results, and do health and exposure surveys. You may also be invited to contribute samples such as DNA for a whole genome sequence used for research.

Joining *All of Us* is optional and is separate from getting the Genomic DNA Test.
